

## **CHAPTER 20**

# **Introduction to Transaction Processing Concepts and Theory**

## **CHAPTER 21**

# **Concurrency Control Techniques**

# Objectives

1. What is transaction.
2. What are ACID Properties
3. Transaction states
4. Concurrency and Problems
5. Conflict and View Serializability
6. Cascade and Cascadeless Schedule

<https://www.youtube.com/watch?v=HAAhn--tZV8&list=PL8UQESWu2gUIRIWjeIDSBp-QKN7OcmwLC>

# Transaction.

Transaction

# Irrecoverable Schedule

## Irrecoverable Schedule

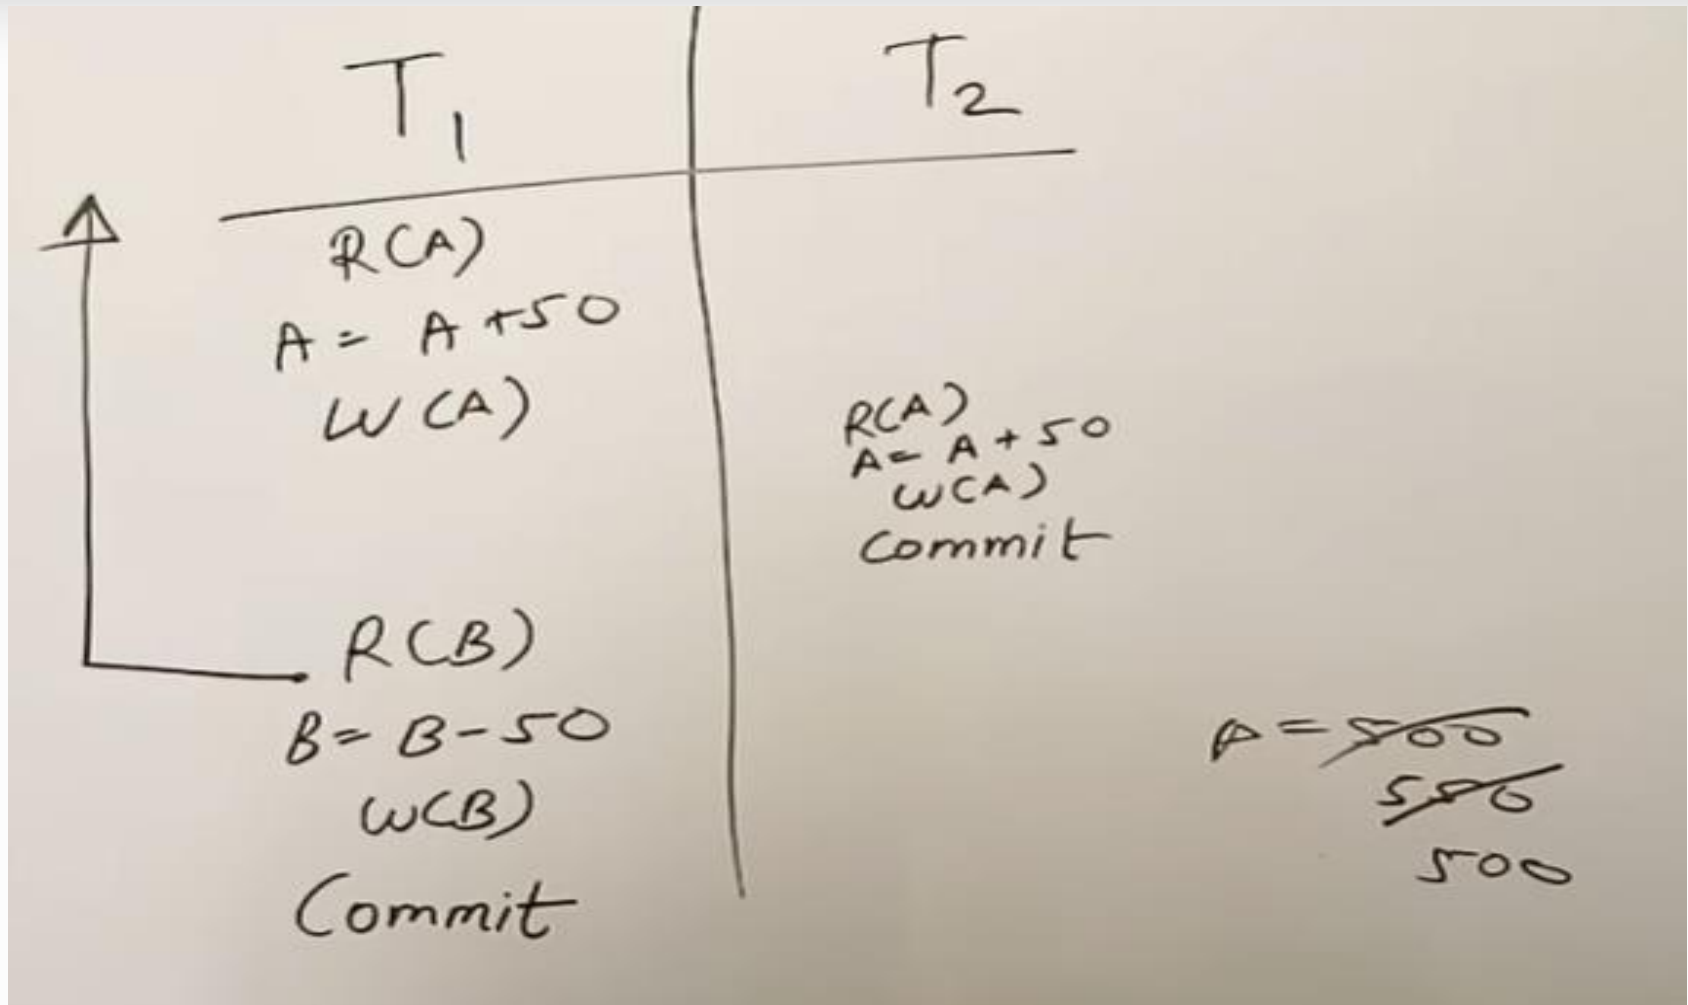

## Irrecoverable Schedule

## Irrecoverable Schedule

## Irrecoverable Schedule Example 02

# Recoverable and Nonrecoverable Schedule

Non-recoverable

\* A committed transaction should never be rolled back.

Recoverable

# What is cascading Schedule

If in a schedule, failure of one transaction causes several other dependent transactions to rollback or abort, then such a schedule is called as a **Cascading Rollback** or **Cascading Abort** or **Cascading Schedule**.

It simply leads to the wastage of CPU time. These Cascading Rollbacks occur because of Dirty Read problems.

# Cascadeless schedule?

**When a transaction is not allowed to read data until the last transaction which has written it is committed or aborted, these types of schedules are called cascadeless schedules**

T1	T2
R(X)	
W(X)	
	W(X)
commit	
	R(X)
	Commit

Here, the updated value of **X** is read by transaction T2 only after the commit of transaction T1. Hence, the schedule is cascadeless schedule.

# Cascading Schedule VS Cascadeless Schedule

## Cascading Schedule

**Disadvantage** : Performance degrade (CPU was not utilized properly)

# Cascading Schedule VS Cascadeless Schedule

## Cascadeless Schedule

# Strict schedule

Given below is an example of a strict schedule –

T1	T2
R(X)	
	R(X)
W(X)	
commit	
	W(X)
	R(X)
	Commit

Here, transaction T2 reads and writes the updated or written value of transaction T1 only after the transaction T1 commits. Hence, the schedule is strict schedule.

# Serializability

<https://www.youtube.com/watch?v=s8QIJolL1G6w&list=PLxCzCOWd7aiFAN6l8CuViBuCdJgiOkT2Y&index=79>

# Serializability

# Conflict Serializability

Check Conflict pairs in other transactions and draw edge

$R(A) - W(A)$   
 $W(A) - R(A)$   
 $W(A) - W(A)$   
Check  
Conflict Pairs

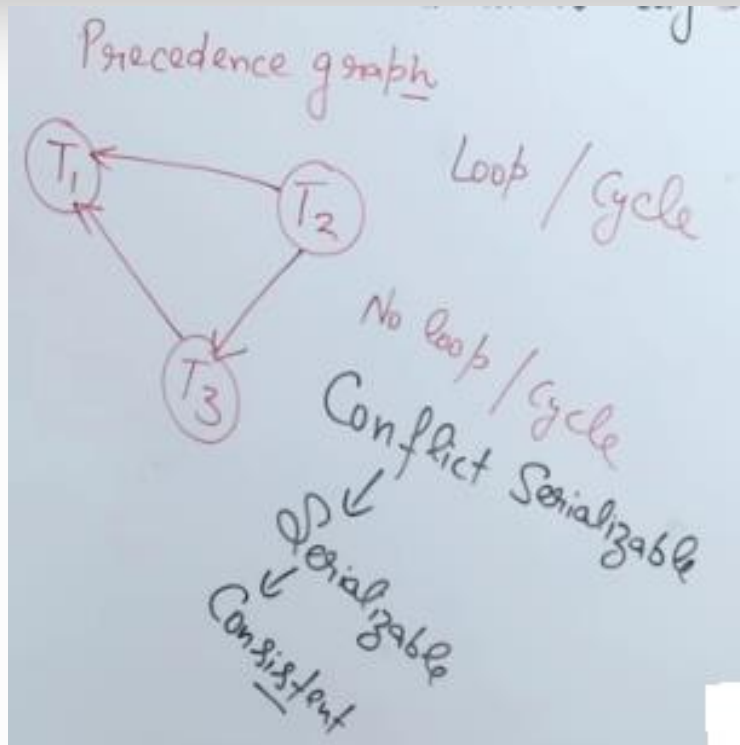

T <sub>1</sub>	T <sub>2</sub>	T <sub>3</sub>
R(x)		R(y) R(x)
	R(y) R(z) w(z)	w(y)
R(z) W(x) W(z)		

T <sub>1</sub>	T <sub>2</sub>	T <sub>3</sub>
R(x)		R(y) R(x)
	R(y) R(z) w(z)	w(y)
R(z) W(x) W(z)		

# Conflict Serializability

T1->T2->T3  
T1->T3->T2  
T2->T1->T3  
T2->T3->T1  
T3->T1->T2  
T3->T2->T1

Now Find  
vertex whose  
indegree = 0

Here  
is T2

Now again Find  
vertex with  
indegree=0

**T2->T3->T1**

Check whether Schedule is Conflict Serializable or not ?

Use View Serialiability to check Non serializable schedule

T <sub>1</sub>	T <sub>2</sub>	T <sub>3</sub>
R(A)		
	W(A)	
W(A)		W(A)

We need to check Conflict serializable through precedence graph

Check Conflict pairs

R(A) -> W(A)

R(A) -> W(A)

W(A)->W(A)  
from T2-T1  
And T2-T3

If it is non serializable, you can check it by **view serialiable** method

S

## View Serialibility

$T_1$	$T_2$	$T_3$
$R(A)$		
	$W(A)$	
$W(A)$		
		$W(A)$

$T_1$	$T_2$	$T_3$
$R(A)$		
$W(A)$		
	$W(A)$	
		$W(A)$

$A=100$  S

$T_1$	$T_2$	$T_3$
$100 R(A)$	$A=A-40$ $W(A)-60$	
$A=A-40$ $60-40$ $=20$		
	$A=A-20$ $W(A)$ $0$	

$A=100$

$T_1$	$T_2$	$T_3$
$100 R(A)$ $60 W(A)$	$20 W(A)$	$0 W(A)$

Both schedules are equivalent.  
It is not conflict equivalent but it is view equivalent

## Shared - Exclusive Locking

**Shared Lock(S)** : If transaction is locked data item in shared mode, then allowed to read only.

**Exclusive Lock(X)** : If transaction is locked data item in shared mode, then allowed to read and write both .

Problems in Shared/Exclusive Locking

- (i) May not sufficient to produce only serializable schedule
- (ii) May not free from irrecoverability
- (iii) May not free from deadlock
- (iv) May not free from starvation

## Shared Exclusive Locking Continue

$T_1$	$T_2$
$S(A)$	<del><math>X(A)</math></del>
$R(A)$	$R(A)$
$U(A)$	$W(A)$
	$U(A)$

### Compatibility table

		Request	
		S	X
grant	S	Yes	No
	X	No	No

SL- $\rightarrow$ SL :

$R(A)$  allowed

SL- $\rightarrow$ XL :

$R(A)$  &  $W(A)$  is not allowed when it is already in  $R(A)$

XL- $\rightarrow$  SL :  $R(A)$  &  $W(A)$  is not allowed when it is already in  $R(A)$

XL- $\rightarrow$  XL :  $R(A)$  &  $W(A)$  is not allowed when it is already in  $R(A)$  &  $W(A)$

# Problems in Shared - Exclusive Locking Continue

## .Problems in Shared/Exclusive Locking

(i) May not sufficient to produce only serializable schedule

T1	T2
X(A)	
R(A)	
W(A)	
U(A)	
	S(A)
	R(A)
	U(A)
X(B)	
R(B)	
W(B)	
U(B)	

In T2 : Can we get Shared lock on R(A)?

Answer No.

It will get shared lock when it will be released by T1

In T1 : Can we get Exclusive lock on R(B) & W(B)?

Answer Yes.

It will get Exclusive lock because it is using different variable i.e. B

# Problems Shared - Exclusive Locking Continue

(ii) May not free from irrecoverability

## Problems Shared - Exclusive Locking Continue

(iii) May not free from deadlock

It is infinite waiting

## Problems Shared - Exclusive Locking Continue

(iv) May not free from starvation

T<sub>1</sub> is waiting for Exclusive Locking on **A**, It will be available as and when shared lock released by other transactions.

***It is finite waiting***

## 2 - Phase Locking (2 PL)

2 PL : It is an extension of Shared-Exclusive Locking.

**Growing Phase :** Locks are acquired and no lock is released.

**Shrinking Phase:** Locks are released and no locks are acquired.

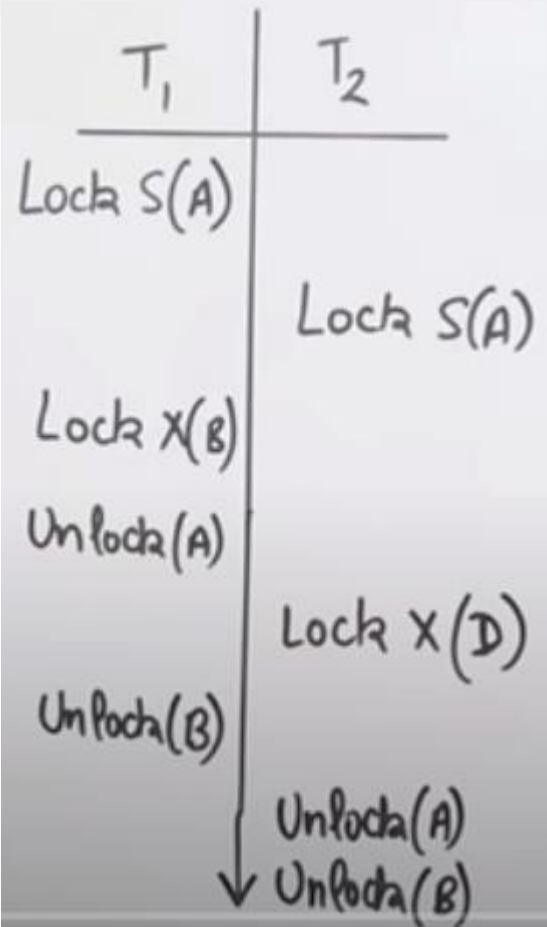

With this model, we can achieve serializability

$S(A)$  will not be granted to  $T_2$  because of  $X(A)$  in  $T_1$

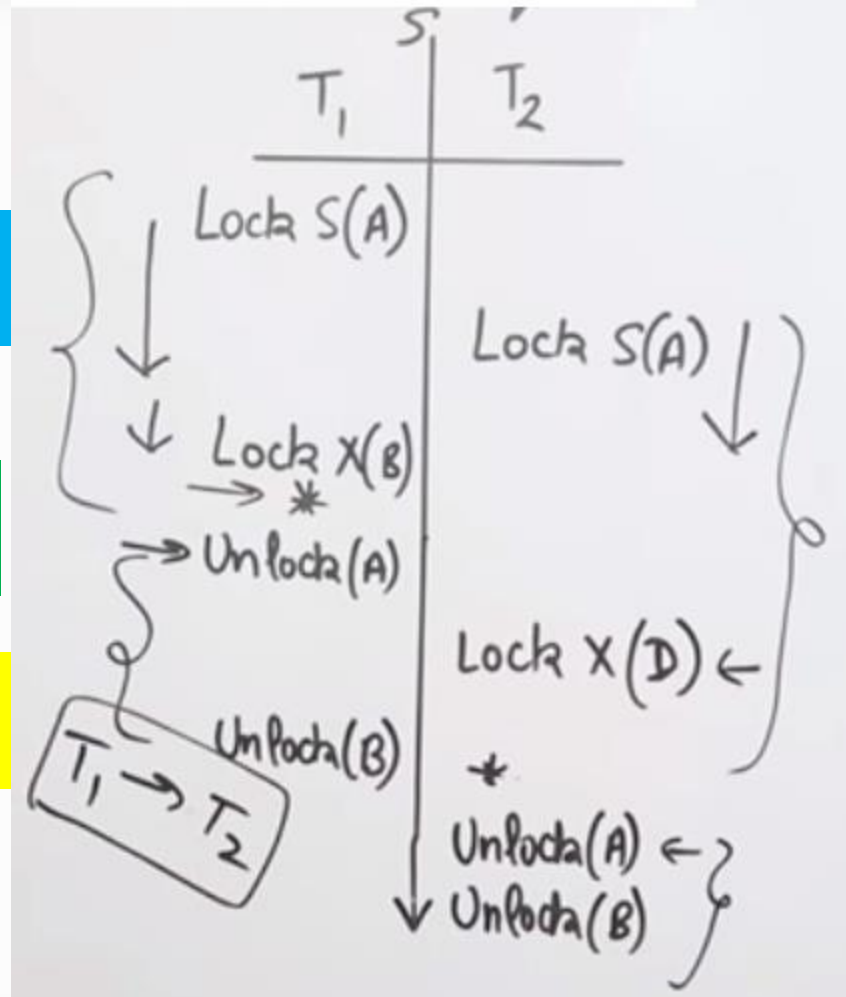

## 2 - Phase Locking (2 PL) Continue
